

# "Double the grid" refinement for NLS

example:  $np=8$

## MPI Communications ( $np \geq 4$ )

$$myid < \frac{np}{2} :$$

$$id\_fine1 = 2 \cdot myid$$

$$id\_fine2 = 2 \cdot myid + 1$$

$$id\_coarse = \text{floor} \left( \frac{myid}{2} \right)$$

$$myid \geq \frac{np}{2} :$$

$$id\_fine1 = 2 \cdot myid - np$$

$$id\_fine2 = 2 \cdot myid - np + 1$$

$$id\_coarse = myid + \text{floor} \left( \frac{np - myid}{2} \right)$$

- data on even processes  $\leftrightarrow$  1st half of work
- data on odd processes  $\leftrightarrow$  2nd half of work

MPI communications for  $np=1$  and  $np=2$  are replaced by copying data

$np=2$ :

$np=1$ :

Array extension

$np \geq 4$ :

first and last quarter of processes exchange all rows

$np=2$ :

process 0 exchanges all rows of work with 1st half of data  
process 1 exchanges all rows of work with 2nd half of data

$np=1$ :

process 0 exchanges 1st half of work with 1st quarter of data  
and 2nd half of work with last quarter of data
